

# Liberty II Bariatric

Dynamic Low Air Loss Mattress Replacement System

The Liberty II Bariatric dynamic Low Air Loss mattress replacement provides continuous low pressure and is designed for use with patients considered to be up to a very high risk of developing pressure ulcers. The system is particularly suitable for use with terminally ill and frail patients together with the treatment of burns and lymphoedema.

## True Low Air Loss therapy

The Liberty II Bariatric delivers **true Low Air Loss** therapy and limits both skin warming and moisture accumulation. **Constant low pressures** provide a gentle support surface that allows patient immersion, increasing the surface area of the skin that is in contact with the mattress resulting in reduced interface pressures.

Excellent **microclimate control** helps to reduce the build-up of heat and moisture ensuring that it is ideal for patients who need special protection from the damaging effects of excess moisture.

## Choice of therapies for customised care

With its choice of therapies, the Liberty II enables nursing staff to create a customised care plan for each patient.

**Pulsate mode** intermittently reduces cell pressures by 40% (variable selectable cycles between 1-120 minutes) to help manage oedema.

**Alternating mode** with variable cycle times provides pressure redistribution for the prevention and treatment of pressure ulcers.

## Prioritising key patient comfort requirements

Addressing key comfort requirements the Liberty II Bariatric is packed with features that will enhance the care and comfort of each patient.

A soft **quilted PU cover** and **TPU cells** provide a comfortable surface for the management of a patient's comfort. While a user-friendly **digital control panel** allows nursing staff to select the appropriate therapy or adjust pressure using Soft and Firm buttons to facilitate pressure redistribution to suit the individual needs each patient.
